1. Executive Summary

ClearAir Works has a clear opportunity in India's commercial indoor air quality market grounded in documented public health data, tightening regulation, and an institutional buyer base with both the need and the budget to act.

In winter 2024-25, 173 of 238 monitored Indian cities exceeded national air quality standards for fine particles[1] (Centre for Research on Energy and Clean Air, 2025). Indoor air in poorly ventilated buildings can be two to five times more polluted than outdoors, yet institutional building penetration for service-backed filtration sits below five percent (Market Research Outlook, 2025) a significant gap in a market growing at 13.5% annually (IMARC Group, 2025).

This report recommends launching in **India, anchored in Delhi-NCR and Bengaluru** cities with the highest concentration of Grade A offices[2], private schools and private hospitals. The primary route to market[3] in Year 1 is direct business-to-business sales[4] supported by HVAC and green building consultant partnerships.[5]

[1]PM2.5: Fine particulate matter 2.5 micrometres or less in diameter. At this size, particles enter the lungs directly. India's national standard: 40 µg/m³. WHO guideline: 5 µg/m³. Delhi averaged 159 µg/m³ in winter 2024-25.

[2]ESG (Environmental, Social and Governance): A reporting framework used by investors and corporations to evaluate sustainability practices. Grade A office tenants with international investors increasingly require measurable indoor air quality data.

[3]Route-to-market: The path a company uses to reach its customers through its own sales team, through distribution partners, or a combination of both.

[4]B2B (Business-to-Business): Commercial activity directed at organisations rather than individual consumers in CAW's case, schools, offices and hospitals.

[5]Channel partner: A third party such as an HVAC contractor or green building consultant that sells or supports a company's products in exchange for a commission, extending market reach without the cost of additional direct staff.

> *First 90 days two priorities: (1) Three to five pilot installations in private schools and corporate offices with a written performance guarantee. (2) Agreements with five to eight authorised channel partners. CAW will not pursue government tenders, Tier 2 or 3 cities, or consumer retail in Year 1.*

2. Context and Problem Definition

2.1 Why India, and Why Now

India's air quality problem is structural, not seasonal. The Commission for Air Quality Management[6] revised its emergency response plan in late 2024. Delhi's fine particle[7] concentration in winter 2024-25 reached 159 µg/m³ four times India's national standard and sixteen times the WHO guideline. When pollution crosses defined thresholds, emergency school closure measures[8] can be triggered, creating direct pressure on school administrators that a CAW installation directly addresses.

India's green building certification programmes create a parallel commercial pull. In 2024, India retained its third global position for LEED[9] certifications, with 370 projects covering 8.5 million square metres (GBCI, 2025). GRIHA[10] certification is mandatory for all new central government construction. Both programmes award measurable points for indoor air quality improvements making a CAW installation a certification asset, not merely a health product.

The India air filtration market was valued at approximately USD 579 million in 2025, growing at 13.5% annually through 2034 (IMARC Group, 2025). The commercial segment institutional rather than household sales remains at an early stage, with most activity in consumer retail, leaving space for a focused, service-led entrant.

2.2 What Makes CAW Different in Commercial Terms

CAW's advantage higher air cleaning output per unit of electricity[11] and longer filter life only creates commercial value when translated into outcomes buyers budget for: a lower total running cost[12] over three years, documented compliance with air quality regulations, and a credible answer to parents, employees or auditors about the building's air quality. Sales conversations start with outcomes, not specifications.

3. Customer and Segment Strategy

3.1 Three Priority Customer Groups

Effective market entry requires focus. CAW targets three types of institution in Year 1 where the problem is urgent, decision-making authority is clear, and a purchase is realistic within twelve months.

---

[6]CAQM (Commission for Air Quality Management): A statutory body established by the Government of India to oversee and enforce air quality standards across Delhi-NCR and surrounding states.

[7]NABH (National Accreditation Board for Hospitals and Healthcare Providers): India's hospital accreditation body. Standards require documented airborne infection control making measurable air quality data directly relevant to accreditation audits.

[8]GRAP (Graded Response Action Plan): Emergency pollution-control measures enforced by the CAQM in Delhi-NCR when air quality crosses defined thresholds. Under Stage III–IV alerts, schools may be ordered to close.

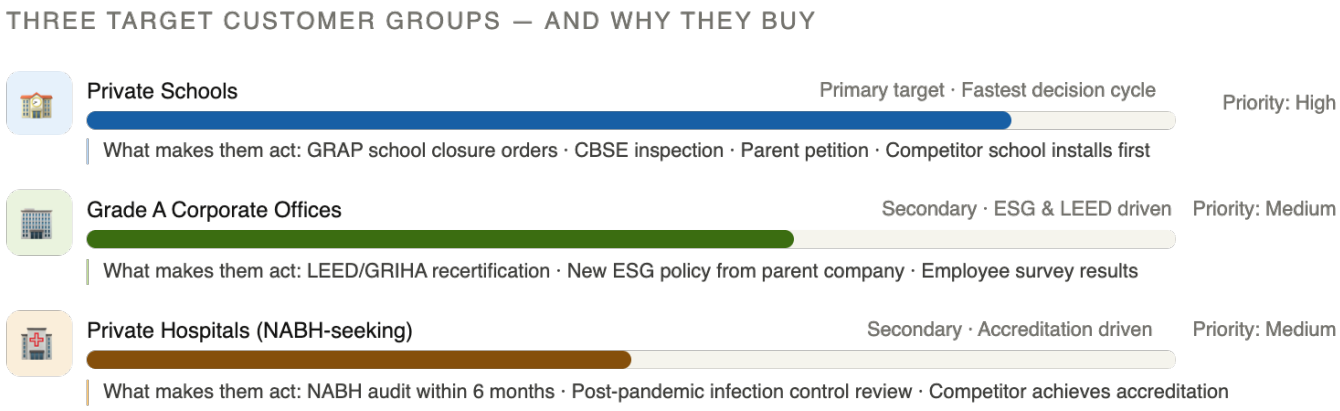

[9]LEED (Leadership in Energy and Environmental Design): An internationally recognised green building certification. In India, 370 projects were certified in 2024. Buildings earn points across categories including indoor air quality.

[10]GRIHA (Green Rating for Integrated Habitat Assessment): India's national green building rating system, mandatory for all new central government construction projects.

[11]CADR (Clean Air Delivery Rate): The standard measure of how quickly an air purifier cleans the air in a space. Higher CADR means more cubic metres cleaned per hour the primary benchmark for comparing air purifier performance.

[12]Total Cost of Ownership (TCO): The full cost of buying and operating a product over its useful life purchase price, installation, energy, maintenance and consumables. More meaningful than list-price comparisons for institutional buyers.

Segment	Decision Maker	What Prompts Action	Priority
Private K-12 Schools (500–5,000 students)	School Principal or Managing Trustee	GRAP school closure; CBSE inspection; parent petition; competitor school installs first	Primary
Grade A Corporate Offices (500+ employees)	Facilities Manager or CFO	LEED/GRIHA recertification audit; new ESG policy; employee health survey results	Secondary
Private Hospitals (NABH-seeking)	Hospital Administrator	NABH audit within six months; post-pandemic infection control review; competitor achieves accreditation	Secondary

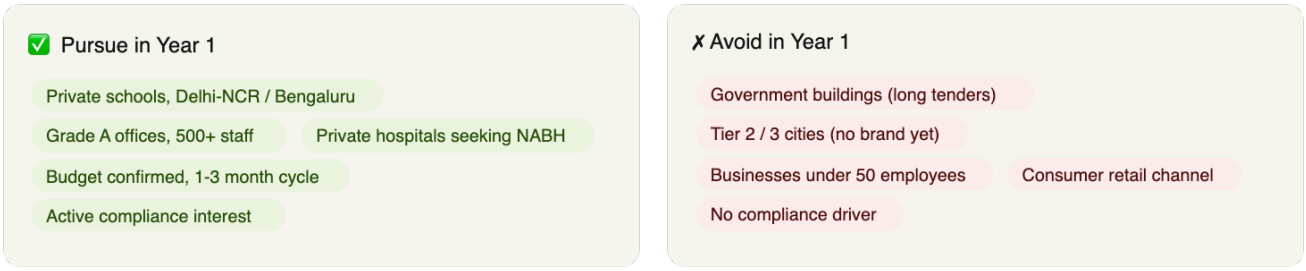

Private schools are the primary target because they combine the shortest decision cycle with the strongest social proof mechanism a school that shares before-and-after air quality data with parents creates immediate pressure on neighbouring schools. Each segment has a specific compliance driver: CBSE inspections for schools, LEED[13]/GRIHA[14] certification for offices, and NABH[15] accreditation for hospitals. CAW's sales approach is built around these drivers, not product features.

3.2 Who CAW Should Not Pursue in Year 1

Defining who not to pursue is as important as identifying target customers. Government buildings involve multi-year tenders CAW lacks the track record to win. Tier 2 and 3 cities require brand recognition that does not yet exist. Organisations under 50 employees produce deal sizes too small to justify acquisition and service costs. Any institution with no active compliance interest is unlikely to purchase within twelve months. This boundary the ideal customer profile[16] keeps a small team focused on winnable accounts.

[15]NABH (National Accreditation Board for Hospitals and Healthcare Providers): India's hospital accreditation body. Standards require documented airborne infection control making measurable air quality data directly relevant to accreditation audits.

[16]Ideal Customer Profile (ICP): A description of the organisation most likely to buy the product and become a profitable long-term customer, used to keep the sales team focused on winnable accounts.

4. Value Proposition and Evidence Strategy

4.1 Five Commitments to Institutional Buyers

A value proposition answers the question every buyer asks: why choose you, over doing nothing or a competitor? For CAW the answer must be specific and measurable a documented outcome, not a technology claim. The five commitments below map directly to what institutional buyers in India measure and report against.

Commitment	Measured By	How CAW Demonstrates It
Lower total running cost over three years	Annual filter + energy cost per unit of air cleaned	Cost comparison report produced after the 90-day pilot
Reduced energy consumption for equivalent output	18–25% lower electricity cost per standard unit of cleaned air	Energy meter readings before and after installation
Documentation for LEED, GRIHA or NABH submissions	Audit-ready air quality data in required format	Compliance report co-designed with green building consultant partners
Service response within 24 hours, or a fee credit applies	Response time logged in service records	Written agreement with a financial penalty for missed response times
Reduction in sick-day absenteeism over six months	Absenteeism data shared by the customer	Health impact report delivered at months six and twelve

4.2 How Evidence Is Built Over 12 Months

Institutional buyers need evidence before committing. In months one and two, three pilots are deployed one school, one office, one clinic with calibrated monitors recording particle levels before and after. At 90 days, a performance report is produced; if targets are not met, CAW replaces units at no cost a written commitment made at the point of sale. By month five, two pilots become reference sites. A publicly available calculator allows any facilities manager to project their three-year cost comparison against CAW's pricing.

5. Competitive Threats and How CAW Responds

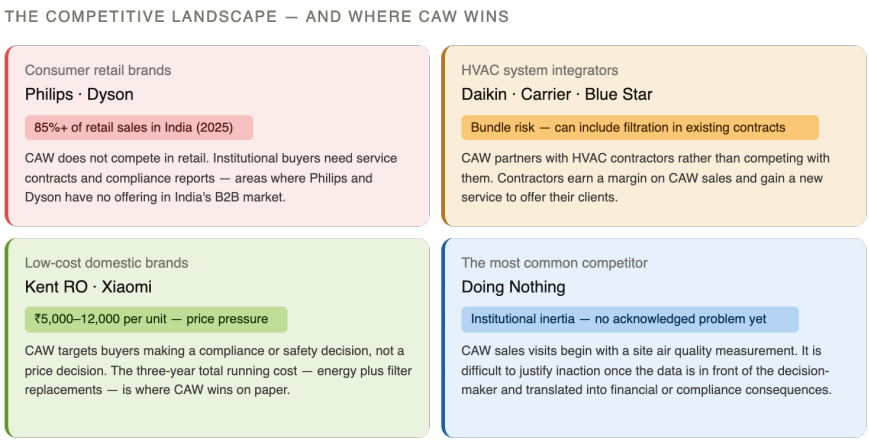

CAW enters a market where several types of competitors already exist. Understanding each show clearly where CAW competes and where it deliberately does not.

Consumer retail brands Philips and Dyson, together holding over 85% of air purifier sales in India in 2025 (Market Research Outlook, 2025) have strong individual buyer recognition but no service contract, no compliance documentation and no site-specific performance guarantee in the institutional market. CAW does not compete on shelf presence or price; it competes on a dimension neither brand is playing on service-backed, compliance-enabling, documented performance for organisations with audit obligations.

HVAC system integrators Daikin, Carrier and Blue Star have facilities manager relationships and can bundle filtration into building contracts. CAW's response is to make these companies partners rather than competitors. They earn a reseller margin on CAW sales, CAW gains access to clients the contractor already services.

Low-cost domestic brands such as Kent RO and Xiaomi create price pressure in smaller institutions. CAW does not match these price points. It shifts every conversation to total running cost[17] over three years where CAW's superior filter life and lower energy consumption produce a more favourable comparison, made concrete through the cost report produced at every pilot's end.

The most frequent competitor, however, is inaction. Many institutions have not formally acknowledged an air quality problem. CAW site visits begin with a measurement, not a pitch. It is difficult to justify doing nothing once data sits in front of a decision-maker alongside its compliance and absenteeism cost implications.

6. How CAW Will Reach Its Customers

6.1 The Sales and Distribution Model

In Year 1, CAW reaches customers through its own direct sales team and a network of authorised partners. A fully direct national team carries fixed costs premature for a startup in validation mode; a partner-only model surrenders control of customer relationships and pricing. The hybrid model balances both the direct team owns important accounts and builds market knowledge; partners extend reach at lower incremental cost. Companies combining direct and partner-led sales consistently outperform those using either alone (McKinsey, 2022). Approximately 70% of Year 1 revenue is expected from direct sales, 20% from HVAC contractor partners, and 10% from green building consultants.

HVAC contractors are the most valuable partner type because they already have the trust of facilities managers who control building budgets an introduction from them carries far more credibility than cold outreach from an unfamiliar brand.

6.2 Partner Operating Rules

Working through partners[18] requires clear rules to prevent price conflicts. Partners register opportunities in CAW's tracking system[19] within 48 hours unregistered opportunities receive no protection. Partners may offer up to 15% off hardware; anything beyond requires Head of Sales approval. CAW handles all service in the first 90 post-installation days; partners take over routine maintenance thereafter.

6.3 Aligning Sales and Marketing

A recurring early-stage failure is that marketing generates enquiries the sales team does not follow up, while sales criticise enquiry quality. CAW defines a qualified contact in advance: the organisation matches the target profile, a decision-influencing person has requested information or agreed to a meeting, and budget or timing has been discussed. Sales must respond within 24 hours and log the outcome within 72 hours. Marketing receives a weekly quality summary that shapes the following week's outreach.

7. The Sales Process and Performance Tracking

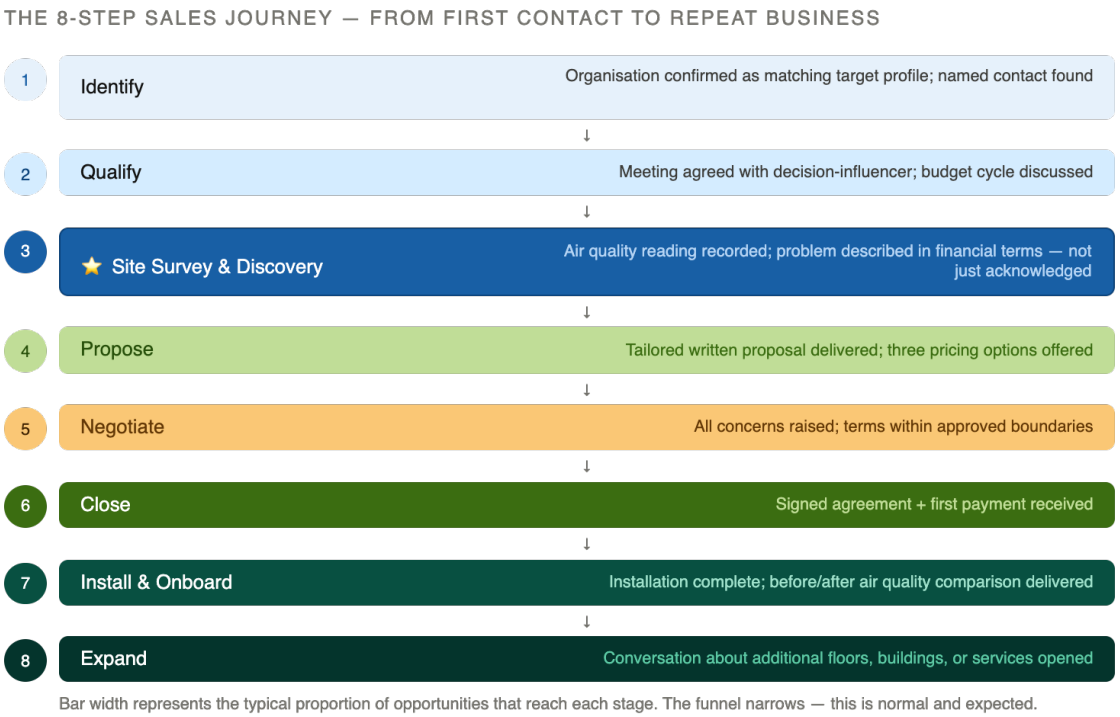

7.1 Eight Steps from First Contact to Repeat Business

Every sale at CAW follows a defined sequence where movement to the next step requires evidence, not just activity. The site visit is structured around consultative questioning[20] asking about the customer's current situation, problems faced, the cost of those problems in practice, and what a solution would be worth. This converts the visit from a pitch into a shared diagnosis, making the subsequent proposal far more likely to match what the customer approves.

The eight steps are: identify a matching organisation and named contact; qualify by agreeing a meeting with a decision-influencer and discussing budget; conduct the site survey; deliver a tailored written proposal with three pricing options; negotiate within agreed pricing limits; close with a signed agreement and initial payment; install and deliver the first performance report; open the expansion conversation about additional floors or buildings.

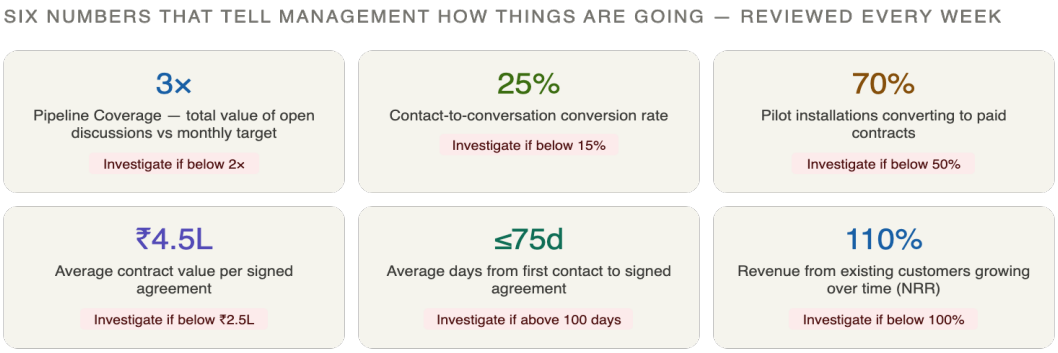

[19]CRM (Customer Relationship Management system): Software that records every customer interaction from first contact through to sale and ongoing service. A well-maintained CRM gives the sales team a shared, accurate view of the pipeline.

[20]Consultative selling (SPIN method Rackham, 1988): A four-part questioning approach Situation, Problem, Implication, Need-Payoff that helps the buyer understand the cost of their problem before a solution is presented. Consistently outperforms feature-led pitching in high-value institutional sales.

7.2 Six Numbers Reviewed Every Week

CAW tracks six weekly indicators: pipeline coverage (open discussions ÷ monthly revenue target, target 3× or above); contact-to-discussion conversion (target 25%); pilot-to-paid-contract rate (target 70% the key Year 1 indicator); average contract value (target INR 4.5 lakh or above); time from first contact to signed agreement (target ≤75 days); and net revenue retention[21] (target 110%). Below 100% signals customer losses outpace existing-account growth. All six are mandatory tracking system[22] fields no Board report is presented without them.

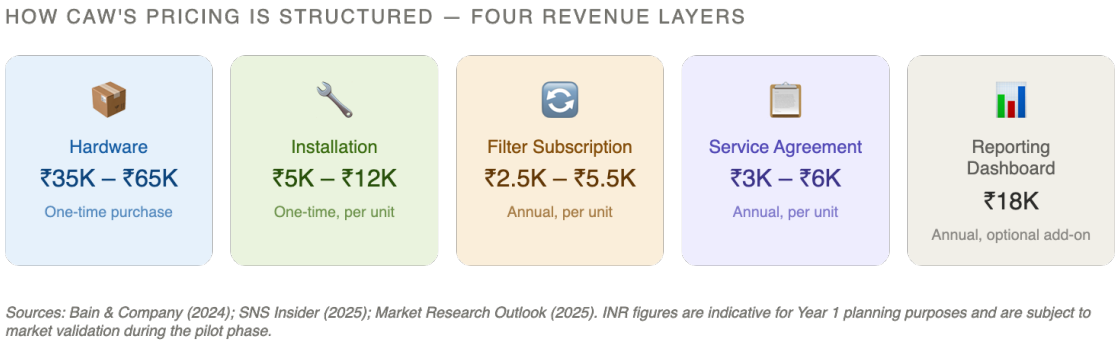

8. Pricing, Packaging and Commercial Policy

8.1 How the Pricing Is Structured

[21]Net Revenue Retention (NRR): A measure of whether revenue from existing customers is growing or shrinking over time. An NRR above 100% means customers are spending more year-on-year the most capital-efficient form of growth.

CAW's pricing is designed so the initial hardware sale begins the commercial relationship, not concludes it. Customers also commit to annual filter replacements and a service agreement, so revenue per customer grows each year without a new sale (Bain & Company, 2024). Hardware: INR 35,000–65,000; installation: INR 5,000–12,000; annual filter subscription: INR 2,500–5,500; service agreements: INR 3,000–6,000 per unit. Optional reporting dashboard: INR 18,000 per year.

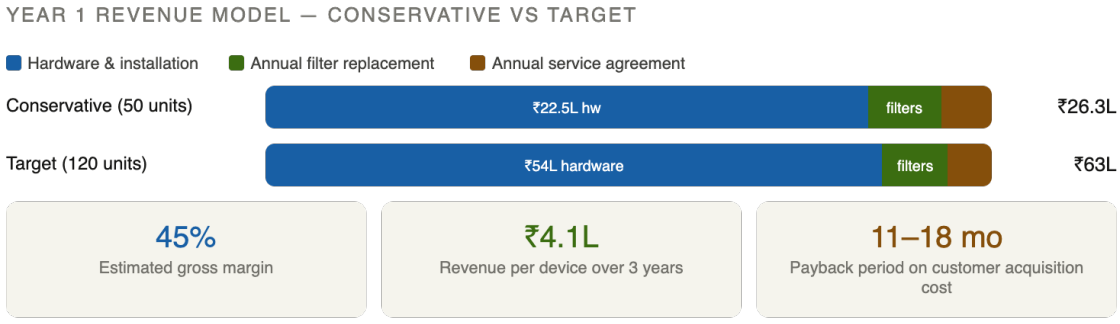

Sources: Bain & Company (2024); SNS Insider (2025); Market Research Outlook (2025). INR figures are indicative for Year 1 planning purposes and are subject to market validation during the pilot phase.

8.2 Pricing Boundaries

Partners may offer up to 15% off hardware; pilot installations receive up to 20% off hardware only service fees are never discounted. Volume orders of ten or more units receive up to 10% off hardware. Reductions beyond these thresholds require Head of Sales approval in writing. This prevents the pattern documented by Bain & Company (2024): companies that raised list prices in 2023 simultaneously increased their discounting, leaving net margin unchanged. Pricing discipline must be established before the first deal, not after.

8.3 A Simple Financial View

In the conservative case of 50 units, hardware and installation revenue reaches INR 22.5 lakh with INR 3.75 lakh in recurring revenue. At an estimated gross margin[23] of 45%, this generates INR 11.8 lakh. At the 120-unit target, hardware revenue reaches INR 54 lakh and gross margin INR 28.4 lakh. The estimated three-year revenue per device is INR 4.1 lakh, with a payback period of 11–18 months on customer acquisition cost.

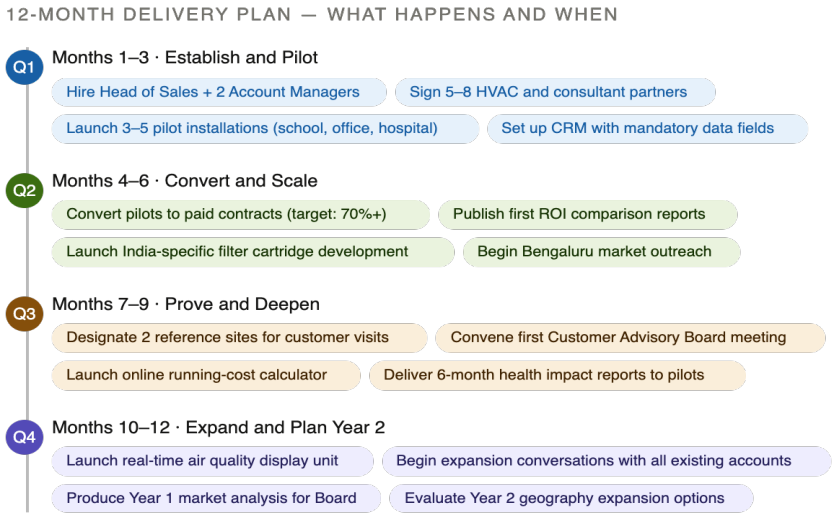

9. Building the Sales Team

9.1 Year 1 Team Structure

Hiring a large team before market validation is a common capital mistake in venture-backed startups. CAW's Year 1 team is five people with clear accountability. The Head of Sales sets strategy, governs partner relationships and

[23]Gross margin: The percentage of revenue remaining after deducting the direct cost of producing and delivering the product. At 45%, every INR 100 of revenue leaves INR 45 to cover operating costs and generate profit.

carries the largest accounts. Two account managers one per city handle the full sales cycle. A sales development representative qualifies enquiries and maintains tracking system accuracy. A customer success manager owns every post-sale relationship: pilots, onboarding, health reports and expansion conversations. A part-time technical resource conducts site surveys and validates proposals.

9.2 Why This Structure Over the Alternatives

Three models were evaluated. A fully direct team offers maximum control but carries costs premature before validation. A partner-only model reduces costs but surrenders control of how the product is presented partner incentives do not always align with CAW's positioning. The hybrid model balances both: the direct team builds knowledge and owns important accounts; partners extend coverage at lower cost. Partner governance rules in Section 6.2 prevent channel conflicts. Salesforce research (2026) confirms that high-performing B2B organisations at this stage invest in process discipline over headcount growth.

10. Strategic Partnerships and Business Development

The most efficient way for a startup to build reach in a new market is to work through relationships already established. CAW targets three partner types in Year 1, each offering access to a distinct part of the target customer base.

HVAC installation contractors specifically Blue Star and Voltas service arms are the highest-priority partner type. They have scheduled access to the facilities managers who control building budgets. A contractor introduction carries credibility that cold outreach cannot replicate. Contractors earn a 12% reseller margin on each CAW sale and receive funded installation training. CAW supplies the product and service contract; the contractor supplies the client relationship and installation capability.

Green building certification consultants professionals accredited under LEED[24] or GRIHA[25] work with building owners to improve scores across environmental categories including indoor air quality. A CAW recommendation from a consultant already engaged on a certification project reaches a buyer who is motivated and has a

compliance budget. Consultants receive an 8% referral payment on completed sales and co-authorship credit on the compliance report produced for their client.

Facility management companies JLL India, CBRE India and Cushman & Wakefield India manage large multi-site commercial estates. Inclusion on their preferred vendor list allows CAW to be specified into new and renewing building contracts across entire portfolios. CAW retains all device and service revenue; the FM company receives preferred pricing.

11. Product Development Priorities

Three physical-product developments support the sales strategy in Year 1, each grounded in a specific customer need from market research.

- **Modular capacity extension (Q2):** A stackable unit design allowing institutions to add air cleaning capacity without replacing the base installation. Institutions cautious about committing to a fixed-capacity system can start with one floor and expand later using the same equipment reducing the initial commitment size and creating a natural upsell pathway.

- **India-specific filter cartridge (Q3):** A filter formulation calibrated for India's particulate profile construction dust, agricultural burning residue and road dust. A filter lasting 18 months rather than 12 in Indian conditions is a concrete, verifiable differentiator in every three-year cost comparison.

- **Real-time air quality display unit (Q4):** A wall-mounted display showing current particle readings and device status. Schools position it at the entrance; hospitals near patient reception. It gives occupants visible evidence the system is working and gives CAW daily brand visibility inside the customer's building.

Any digital features dashboards, notifications support the physical product's performance evidence. In Year 1, CAW is a hardware and service business.

12. Keeping Customers and Growing with Them

Winning a customer is expensive; keeping one and growing revenue from them is substantially more profitable. Research shows that customers rating their experience as excellent are significantly more likely to renew and expand their purchase (PwC, 2024). In CAW's market, where switching costs at renewal are relatively low, the post-sale experience determines whether the customer remains one.

The first 90 days after installation follow three formal checkpoints. At day 30, the customer success manager delivers the first air quality comparison report the moment the customer sees in data that the investment is working. At day 60, a training session helps facilities staff use the display unit and log service requests. At day 90, a review with the original decision-maker presents the performance summary and opens discussion about expanding to additional floors or buildings.

By month nine, CAW establishes a Customer Advisory Board six to eight early accounts meeting quarterly to review performance and contribute to the product roadmap. This creates structural loyalty among accounts most likely to expand and refer others.

Every six months, each account receives a health impact report linking air quality trends and filter performance to published research on absenteeism rates (Lemon & Verhoef, 2016). This shifts the customer's perception from maintenance supplier to long-term compliance partner the relationship that makes renewal the obvious decision.

13. Summary

The case for CAW entering India's commercial air quality market rests on three converging realities: a public health crisis institutional buyers can no longer ignore, a regulatory environment that creates direct compliance consequences for inaction, and a commercial segment largely unaddressed by existing market participants.

The strategy here is built around focus two cities, three customer segments, a small accountable team, and a pricing model that turns each installation into a multi-year revenue relationship. Every element connects: target segments determine value commitments; value commitments shape the pilot programme; pilots generate reference cases that make each subsequent sale easier; weekly tracking keeps the team focused on what matters.

The Recommendation That Connects Everything

CAW should develop a segment-specific Compliance Documentation pack, a written audit-ready document mapping CAW's measured performance to the inspection criteria used by CBSE inspectors, LEED and GRIHA auditors, and NABH assessors. No air quality product currently sold in India's B2B market offers this as a standard purchase deliverable. It removes the final buyer objection: whether the purchase will satisfy the auditor.

India's commercial indoor air quality market will not remain open indefinitely. As HVAC majors recognise the opportunity and begin bundling filtration into contracts, the window for CAW to establish a differentiated service-led position will narrow. The twelve months outlined here are the period in which CAW can set the terms on pricing, on service standards, and on what proof means in this category.

STRATEGY AT A GLANCE — 12 DECISIONS THAT CONNECT

Geography India — Delhi-NCR & Bengaluru first	How customers are reached Hybrid: direct sales + channel partners
Primary customer type Private K-12 schools (anchor segment)	Why customers buy Cost savings + compliance + health outcomes
How trust is built Pilot → performance report → reference site	How revenue grows Hardware sale → annual filter + service contract
Sales approach Site survey first; solution second (consultative)	Performance tracking 6 mandatory KPIs reviewed weekly in CRM
Key partners HVAC contractors + LEED/GRIHA consultants	Team size 5-person hybrid team — lean and accountable
Product priorities Modular units · India filter · Air quality display	Customer retention 30-60-90 onboarding + health reports + advisory board

This report draws on course materials including Cranney (2017), Rackham (1988), Lemon & Verhoef (2016), and Bain & Company (2024), alongside industry data from IMARC Group, GBCI, CAQM, and McKinsey & Company (2022–2025).
