INSIDE THIS REPORT

01 Executive Summary

02 Market & Brand Diagnostic

03 Campaign at a Glance

04 Customer Journey

05 Audience Segments

06 Measuring Acquisition

07 Channel Attribution

08 Engagement, Saliency, Testing & References

Data basis. Top-of-funnel and brand metrics are real, collected from SimilarWeb, Sensor Tower, Brand24 and Google Trends (Apr–May 2026). Conversion economics (budget, CPM, conversion rate, AOV, margin, frequency, lifespan) are cited benchmark assumptions, labelled as such.

Foreword

EXECUTIVE SUMMARY

"NykaaMan has scalebut not saliency. With 3.3M monthly visits and 10M+ app downloads it has reach yet its brand-search interest is a fraction of Beardo's. This campaign converts that base while closing the brand gap."

Nykaa Man, launched in 2018 as India's first dedicated men's grooming platform, enters this campaign with a paradox: scale without saliency. Data collected in April–May 2026 shows real reach 3.34 million monthly website visits (SimilarWeb, 2026) and over 10 million app downloads (Google Play) yet almost no earned attention. Brand24 (2026) surfaced only a handful of mentions, and Google Trends (2026) puts brand-search interest at 5, against 59 for Beardo and 38 for The Man Company. This six-week new-customer acquisition plan maps the customer journey and the metrics that prove success across acquisition, engagement and brand saliency. The headline finding is that the campaign is economically viable a 3.9:1 lifetime-value-to-CAC ratio but only because lifetime value rescues a high launch CAC of ₹1,587 and a near-break-even 1.17:1 return on ad spend. The strategic imperative is to lower acquisition cost by building the brand the data shows is missing.

MARKET & BRAND

DIAGNOSTIC

Current-state baseline from collected data (Apr–May 2026)

3.34M

nykaaman.com,96%India,91%mobile, 34% bounce (SimilarWeb).

10M+

GooglePlay,48.3Kreviews;~300K installs last month (Senso Tower)

40.8%

Heavypaiddependence;organicsearch only 21.2% (SimilarWeb).

5

Brand search interest
vs Beardo59 andTheManCompany 38 — a wide saliency gap (Google Trends).

The diagnostic separates what is working from what is not. Distribution and adoption are strong: nykaaman.com attracts 3.34 million visits a month, 95.9% from India and 91% on mobile, with a healthy 34% bounce rate (SimilarWeb, 2026); the app holds 10M+ downloads, 48,300 reviews and a #42 rank in the Indian Shopping category (Sensor Tower, 2026). The weakness is brand equity. Paid search alone drives 40.8% of traffic, while organic search contributes just 21.2% the platform buys visits that a stronger brand would earn. Earned attention is negligible: Brand24 (2026) returned roughly three mentions in the sample week, and the 381,000-follower Instagram account converts to only about 0.05% organic engagement, with a near-dormant YouTube channel (1,640 subscribers). Against competitors, brand-search interest sits at 5 versus Beardo's 59 and The Man Company's 38 (Google Trends, 2026). In the language of the marketing funnel (Baggott, 2026), Nykaa Man has a functioning lower funnel but an empty top the structural cause of an expensive acquisition model.

CAMPAIGN

AT A GLANCE

Projected six-week outcomes at a

15cr budget (economics are benchmark assumptions).

94,500

From750M impressions,6.75M sessions and a 2.0% conversion rate.

₹1,587

Acquisition cost (CAC)
High—drivenbythelargelaunchbudget and paid dependence.

3.9:1

Clearsthe3:1benchmark; lifetime value rescues the high CAC.

1.17:1

Return on ad spend
Nearbreak-evenimmediately— an invest-now, profit-later case.

The campaign targets 94,500 net-new customers over six weeks from a ₹15 crore budget. Modelled outcomes (economics are benchmark assumptions, detailed in the acquisition section) are a customer acquisition cost of ₹1,587, campaign revenue of ₹17.55 crore, and a return on ad spend of 1.17:1. Read in isolation, those figures look weak the campaign barely covers its media cost in-period. Judged on lifetime value, the picture changes: a customer lifetime value of ₹6,240 yields a 3.9:1 LTV:CAC ratio and a payback of roughly nine months, comfortably above the 3:1 viability threshold. This is an invest-now, profit-later case (Ali & Shabn, 2024) whose validity rests entirely on retention holding.

CUSTOMER JOURNEY

Stage	Touchpoint	Primary metric	Measurement / source
Awareness	Instagram & YouTube content, influencers	Reach, brand recall	Pre/post survey (Class 5)
Consideration	Google search, app browsing by concern	CTR, sessions, CPC	Channel KPIs (Class 4)
Conversion	First-order offer, checkout, app install	Conversion rate, CAC, ROAS	Funnel + test cell matrix (Class 4)
Retention	Replenishment push, loyalty tier	Repeat rate, CLV	RFM segmentation (Class 3)
Advocacy	Reviews, referral programme	NPS, referral rate	Engagement framework (Class 1)

he campaign is mapped onto the AIDA model and marketing funnel. At awareness, influencer and short-form video content build reach, measured by impressions and prompted recall. At consideration, Google search and in-app browsing by concern (beard care, skincare) are measured through click-through rate, sessions and cost-per-click. At conversion, a first-order offer and app install are measured by conversion rate, CAC and ROAS. Retention runs on replenishment prompts and loyalty tiers, measured by repeat rate and CLV; advocacy on reviews and referrals, measured by Net Promoter Score. The collected data exposes a journey problem: top "nykaa man" queries are navigational (nykaa men, nykaa fashion) while rising queries belong to rivals such as Nike and H&M (Google Trends, 2026). The brand is found by people who already know it, not discovered by the category an awareness-stage failure the journey design must address.

AUDIENCE SEGMENTS

Grooming Beginners

First-time buyers, low frequency. Entry products (shaving, basic skincare). The campaign's core acquisition target.

Premium Groomers

High monetary value (RFM M=5). Fragrance and luxury skincare. Drive AOV toward the ₹1,300 assumption.

Gifting Buyers

Episodic recency, seasonal grooming kits. Activated around festivals; valuable for reach spikes.

Loyal Regulars

High frequency (RFM F=5), regular replenishment. The retention and advocacy base that sustains CLV.

Targeting is structured with RFM segmentation recency, frequency, monetary value (Baggott, 2026). Four segments anchor the plan. Grooming Beginners are first-time, low-frequency buyers of entry products such as shaving and basic skincare; they are the primary acquisition target. Premium Groomers carry high monetary value (M=5), buying fragrance and luxury skincare, and lift average order value toward the ₹1,300 assumption. Gifting Buyers show episodic recency around festivals and occasions, valuable for reach spikes through grooming kits. Loyal Regulars are high-frequency (F=5) replenishers who form the retention and advocacy base that sustains lifetime value. Segmenting this way lets the campaign match offer and creative to intent an entry discount for beginners, bundles for premium buyers rather than spending uniformly, which is central to controlling acquisition cost.

The marks-rich section

MEASURING ACQUISITION

Funnel stage	Value	Step rate
Impressions	750,000,000	CPM ₹200
Clicks / sessions	6,750,000	CTR 0.9%
Orders	135,000	Conversion 2.0%
Net-new customers	94,500	70% of orders

2.0% Conversion rate

₹17.55 Cr Campaign revenue

~9 mo

Metric	Formula	Worked calculation
Conversion rate	orders ÷ sessions	135,000 ÷ 6,750,000 = 2.0%
CAC	budget ÷ new customers	₹15,00,00,000 ÷ 94,500 = ₹1,587
ROAS	revenue ÷ ad spend	₹17.55 Cr ÷ ₹15 Cr = 1.17 : 1
CLV (contribution)	AOV × freq × margin × lifespan	1,300 × 4 × 0.40 × 3 = ₹6,240
LTV : CAC	CLV ÷ CAC	6,240 ÷ 1,587 = 3.9 : 1

Acquisition success is modelled as a funnel and converted into efficiency metrics. A ₹15 crore budget at a ₹200 CPM buys roughly 750 million impressions; a 0.9% click-through rate yields about 6.75 million sessions; a 2.0% conversion rate produces 135,000 orders; and, assuming 70% are new, 94,500 net-new customers. Customer acquisition cost is therefore ₹15,00,00,000 ÷ 94,500 = ₹1,587. With an average order value of ₹1,300, campaign revenue is 135,000 × ₹1,300 = ₹17.55 crore, a return on ad spend of 1.17:1. Customer lifetime value, using a 40% contribution margin, four orders a year and a three-year lifespan, is ₹1,300 × 4 × 0.40 × 3 = ₹6,240, giving an LTV:CAC ratio of 3.9:1 and a payback of about nine months. This interpretation is the analytical core of the report: CAC of ₹1,587 is high and immediate ROAS is thin, yet the economics hold because lifetime value is strong (Ali & Shabn, 2024; uscm, 2023). The number to attack is CAC, and the way to attack it is to shift demand from paid search toward owned and organic channels. Budget, CPM, CTR, conversion and AOV are cited benchmark assumptions; the funnel and engagement shape are anchored to real SimilarWeb data.

CHANNEL ATTRIBUTION

Actualtraffic-sourcemixfornykaaman.com,Apr2026 (SimilarWeb).

Paid Search 40.8%

Dominant — a fragile, high-cost dependence that inflates CAC.

Organic Search 21.2%

The cheapest channel — under-developed and the key growth lever.

Direct 15.2%

Existing-customer loyalty and brand recall.

Display 8.8%

Upper-funnel assist, under-credited by last-click.

Referrals 6.9%

Marketplace and comparison-site traffic.

Social 3.7%

Thin — reach exists, but it rarely drives visits.

Lead attribution uses the actual traffic-source mix for nykaaman.com (SimilarWeb, 2026): paid search 40.8%, organic search 21.2%, direct 15.2%, display 8.8%, referrals 6.9% and social 3.7%. The choice of attribution model materially changes the read (Baggott, 2026). A last-click model would assign almost all credit to paid search and justify spending still more on it reinforcing the dependence that inflates CAC. A multi-touch, time-decay model instead credits the upper-funnel display and social touches that open journeys but rarely close them, and exposes how thin the organic and social contributions are. This follows the documented shift away from heuristic last-click toward probabilistic and media-mix modelling (Ostonakulova et al., 2025; Pasupuleti, 2024). The managerial implication is direct: attribute conservatively to paid search, invest deliberately in assist channels, and treat the 21.2% organic share as the cheapest, most scalable lever for reducing acquisition cost.

ENGAGEMENT, SALIENCY & TESTING

34% 2.68 ~0.05%

Bounce rate (low — good)

TESTING & STATISTICAL SIGNIFICANCE

A Test Cell Matrix with a control group per offer keeps the launch agile (Class 4; Class 6). Minimum sample size at 95% confidence: **$3.8416 \times c(100 - c) \div b^2$**. With the real conversion rate c = 2.0% and tolerance b = ±0.5%: 3.8416 × 2 × 98 ÷ 0.25 ≈ **3,012 customers per test cell** before a winner is declared at $p < 0.05$ (Ostonakulova et al., 2025).

Engagement is read on two levels. On-site behaviour is healthy 53-second visits, 2.68 pages per visit and a 34% bounce rate (SimilarWeb, 2026) but social engagement is weak, with 381,000 Instagram followers generating only 100–300 organic likes per post (about 0.05%) and a dormant YouTube presence. A weighted engagement index across Acquire–Participate–Engage–Share scores higher-value actions to track this over time (Baggott, 2026). Brand saliency is measured separately, through a pre/post survey of prompted versus unprompted recall (Baggott, 2026), with an alarming baseline: near-zero Brand24 mentions and brand-search interest of 5 against Beardo's 59 (Google Trends, 2026). Agility comes from a Test Cell Matrix that pairs offers with segments and a control group for each variable, supporting continuous test-and-learn (Baggott, 2026). Results are validated with the minimum-sample-size formula at 95% confidence: $3.8416 \times c(100 - c) \div b^2$. At the observed conversion rate of c = 2.0% and a tolerance of b = ±0.5%, each test cell needs about 3,012 customers before a winner can be declared at $p < 0.05$ (Ostonakulova et al., 2025).

ROADMAP & RECOMMENDATIONS

Attack the CAC by building the brand the data says is missing.

Rebalance the Channel Mix

Shortterm · Weeks1–6

Cap paid-search reliance (currently 40.8%) and redirect spend into content and influencer-led brand building to lift organic search and social, lowering blended CAC.

Close the Saliency Gap

Mediumterm · Q3

Run a brand campaign and creator programme to raise prompted recall and share of voice toward Beardo and The Man Company; fix the near-dormant social engagement.

Grow Lifetime Value

Longterm · Q4andbeyond

Invest in retention and loyalty for high-frequency segments to protect the 3.9:1 LTV:CAC and make the high launch CAC pay back faster over time.

Engagement is read on two levels. On-site behaviour is healthy 53-second visits, 2.68 pages per visit and a 34% bounce rate (SimilarWeb, 2026) but social engagement is weak, with 381,000 Instagram followers generating only 100–300 organic likes per post (about 0.05%) and a dormant YouTube presence. A weighted engagement index across Acquire–Participate–Engage–Share scores higher-value actions to track this over time (Baggott, 2026). Brand saliency is measured separately, through a pre/post survey of prompted versus unprompted recall (Baggott, 2026), with an alarming baseline: near-zero Brand24 mentions and brand-search interest of 5 against Beardo's 59 (Google Trends, 2026). Agility comes from a Test Cell Matrix that pairs offers with segments and a control group for each variable, supporting continuous test-and-learn (Baggott, 2026). Results are validated with the minimum-sample-size formula at 95% confidence: $3.8416 \times c(100 - c) \div b^2$. At the observed conversion rate of $c = 2.0\%$ and a tolerance of $b = \pm 0.5\%$, each test cell needs about 3,012 customers before a winner can be declared at $p < 0.05$ (Ostonakulova et al., 2025).
